

ABSTRACT OF THE DISCLOSURE

A method for servicing digital broadcasting, capable of defining a control message necessary for servicing digital broadcasting of a SD (Standard) level and a HD (High Definition) level through, a network of, for example, a x Digital Subscriber Line, by directly requesting, at a client, a digital broadcasting server for a session connection, and establishing a session by receiving a confirmation from the digital broadcasting server. Also, a channel change can be requested by directly requesting, at the client, the digital broadcasting server for a channel change, and changing a channel by receiving a confirmation from the digital broadcasting server. Other direct client-server requests and confirmations include a message for checking a status of the client and a session termination.
